Question & Answer:

1. Are dashboard values loaded dynamically from the database?

Yes, dashboard values are loaded dynamically from the MySQL database using SQL queries. The dashboard displays the total number of users, students, events, and registrations. When records are added or deleted, the values update after refreshing the dashboard.

2. Is access restricted to admin users?

Yes, access to the admin dashboard is restricted to authenticated users with the admin role. The authentication system checks the user's session and role before allowing access. Students cannot access admin-only pages.

3. Are role-based menus working?

Yes, role-based menus display options according to the logged-in user's role. Administrators can access management features, while students see student-specific options. This helps prevent students from accessing administrative features through the menu.

4. Are important admin actions recorded in audit_logs?

Yes, important administrative actions are recorded in the audit_logs table. These include dashboard access and successful student or event create, update, and delete operations. The records help track administrative activities and verify changes made to the system.

Conclusion / Learning Outcome:

In conclusion, Practical 14 helped us develop a StudentHub admin dashboard using PHP, MySQL, and session management. The dashboard displays important information dynamically from the database. Role-Based Access Control (RBAC) helps restrict access according to user roles. Dynamic menus provide different options for administrators and students. The audit logging system records important administrative activities in the audit_logs table. The project improves security, monitoring, and management of student and event information. Overall, this practical helped us understand authentication, authorization, database connectivity, and audit logging in web applications.
